

FOR IMMEDIATE RELEASE

MUSIM Launches As A Muat + Simpan App For Downloading Professional Video Assets

A focused WartaAI sub-project built for professional users who need a simpler way to save video and audio assets for legitimate work.

KUALA LUMPUR, 10 July 2026 - In media work, one small task often takes more time than it should: saving video assets quickly, cleanly, and without friction. Sometimes it is your own content. Sometimes it is a client-approved asset. Sometimes it is a reference clip for reporting, editing, archiving, or production work.

That is where **MUSIM** comes in. MUSIM, short for **Muat + Simpan**, is a desktop app built to solve one clear problem: helping professional users download and store video and audio assets from supported platforms in a direct, simple, work-friendly way.

MUSIM is developed as a sub-project by the **WartaAI** team while **wartaai.com** is being rebuilt with new branding for **WartaOne** and **WartaAI**. Rather than waiting for the full WartaAI ecosystem to be finished, the team chose to ship a practical standalone tool first.

Key Summary

MUSIM focuses on one daily media workflow that often becomes needlessly frustrating: paste a link, download the asset, save it, and keep working.

Product Name	MUSIM - Muat + Simpan
Built By	The WartaAI team, as a sub-project while WartaAI and WartaOne move through a new branding phase.
Platform	macOS Apple Silicon; Windows version also available.
Tech Stack	SwiftUI, yt-dlp, FFmpeg, Deno, with technical reference from VidBee on GitHub.
AI Partners	Claude Fable 5, ChatGPT 5.5 family, Google Gemini 3.5 Flash, and Google Omni Flash.

For Professional Users Who Understand Media Work

Many platforms today are strict about how content can be downloaded. From a platform perspective, that can be understood. But in real production workflows, especially for video editors, journalists, social media managers, creative agencies, marketing teams, and content creators, there is still a daily need to save video assets for legitimate work.

MUSIM removes that friction. At the same time, MUSIM is intended for professional users who understand copyright, platform terms, content ownership, and permission. It is not a licence to steal content, repost without consent, or violate copyright.

In simple terms: MUSIM is built for users with common sense. It is suitable for owned content, client-approved assets, public-domain material, licensed media, content users have permission to save, or video needed for legitimate work such as review, archiving, research, criticism, reporting, and production.

Simple UI, macOS-Friendly, Built To Just Work

The macOS version of MUSIM is built natively with **SwiftUI**, giving it the feel of a proper Mac app. It includes a clean interface, download queue, platform detection, quality choices, format settings, library, notes, folder management, and basic tools for handling files after download.

MUSIM uses engines such as **yt-dlp**, **FFmpeg**, and **Deno** to handle downloading and media processing. For normal users, all of this stays behind the scenes. The intended experience is simple: open the app, paste the link, download, and save.

Supported platforms include YouTube, TikTok, Instagram, X, Facebook, Vimeo, Twitch, SoundCloud, Bilibili, Reddit, and many other platforms supported by the yt-dlp ecosystem. A Windows version is also available with a simpler and more direct approach.

Built With GitHub VidBee As A Core Source Reference

MUSIM takes its main technical reference from the open-source **VidBee** project on GitHub, especially around download workflow, technical structure, and open-source direction. For macOS, MUSIM has been rebuilt as a native app designed for Apple Silicon users.

This gives MUSIM a sensible balance: simple and friendly on the surface, backed by technology that developers and media power users already understand.

AI As A Development Partner, Not Just A Gimmick

MUSIM was developed with several AI models as working partners. **Claude Fable 5** served as the main coding partner, helping shape the app experience, code structure, and feature implementation.

ChatGPT 5.5 family was used for research, product thinking, and early logo drafts. **Google Gemini 3.5 Flash** supported additional research and logo exploration, while **Google Omni Flash** was used to create the logo reveal asset.

The result is not only a working app, but a small product with its own visual identity across icons, graphics, logo, and launch material.

A Small Sub-Project From A Bigger WartaAI Direction

MUSIM is not the full WartaAI platform. It is a focused sub-project from the same team, released while the wider WartaAI and WartaOne branding work continues.

For the WartaAI team, MUSIM reflects the direction they want to build toward: practical tools, low-friction workflows, and software shaped around how media people actually work. Not every useful product needs to be a large platform. Sometimes a small app that solves one problem well is enough.

Availability

MUSIM is available now for macOS Apple Silicon. A Windows version is also available with a simpler and more direct experience. Download MUSIM here: www.grdivejafnjksFDKS.COM. This link is a placeholder until the official download URL is finalized.

About MUSIM

MUSIM, or **Muat + Simpan**, is a desktop app built to help professional users download and store video and audio assets for legitimate work. It focuses on a simple, fast, local-first, user-friendly experience.

WartaAI is a Malaysian technology and media initiative currently undergoing a new branding phase together with **WartaOne**. MUSIM is released as a practical sub-project while development of the wider WartaAI ecosystem continues.
